

CONFIDENTIAL

UNIVERSITI TUN HUSSEIN ONN MALAYSIA

**FINAL EXAMINATION
(TAKE HOME)
SEMESTER II
SESSION 2019/2020**

COURSE NAME : MECHANICAL SCIENCES
COURSE CODE : BEF 25903
PROGRAMME CODE : BEV
EXAMINATION DATE : JULY 2020
DURATION : 3 HOURS
INSTRUCTION : ANSWER ALL QUESTIONS
OPEN BOOK EXAMINATION

THIS QUESTION PAPER CONSISTS OF **FOUR (4)** PAGES

TERBUKA
CONFIDENTIAL

- Q1** (a) Free body diagram is an essential tool in static problem evaluation. Explain the step required in order to sketch an appropriate free body diagram. (10 marks)
- (b) **Figure Q1 (a)** shows a system equilibrium at ring A. Sketch the free body diagram of the system and determine the tension in cable AB and AD for equilibrium of the 2kN engine. (10 marks)
- Q2** (a) Define term 'kinematics' and give one example. (5 marks)
- (b) Define term 'kinetics' and give one example. (5 marks)
- (c) A disc with a radius of 50cm rotates from rest to a constant speed of 2 rad/s². Determine:
(i) the final rotational speed after 12s.
(ii) the numbers of revolution the disc made during the period of 12s. (10 marks)
- Q3** (a) Explain the term 'primary bonding' and 'secondary bonding' in materials structure. (8 marks)
- (b) Define the characteristics of metals, ceramics and polymers in terms of its properties, atomic structure and bonding. (8 marks)
- (c) Define the differences between the elastic and plastic deformation in terms of the effect on the crystal lattice structure with the help of appropriate illustrations. (4 marks)
- Q4** (a) States the properties of fluids. (6 marks)
- (b) A lump of clay is put into a tank filled with water and the lump sinks. However, when the same clay is shaped as a boat, it floats. Explain this observation. (6 marks)
- (c) Find the hydrostatic force on the following plate submerged in water as shown in **Figure Q4**. (8 marks)

- Q5** (a) Explain the basic concept of thermodynamics. (5 marks)
- (b) Explain the two primary classes of thermodynamic cycles. (5 marks)
- (c) An ideal gas is contained in a closed assembly with initial pressure and temperature of 220 kPa and 70°C respectively. If the volume of the system is increased 1.5 times and the temperature drops to 15°C, determine the final pressure of the gas. (10 marks)
