- Q1** (a) A steel screw is attached to a steel body, with time, the area at the bottom of the screw starts to corrode. Choose suitable solutions to prevent this corrosion from happen. (5 marks)
- (b) Examine how the atmospheric corrosion can be measured. (7 marks)
- (c) Evaluate the need of cathodic protection for some construction with suitable sketch. (8 marks)
- Q2** (a) According to the emf series in **Table Q2 (a)**, zinc has a more reactive potential than iron. Therefore zinc should corrode more easily than iron, but, surprisingly, iron will corrode faster than zinc. Interpret this situation. (5 marks)
- (b) What are the differents between sacrificial anode and impressed current in cathodic protection. (7 marks)
- (c) With an appropriate diagram, briefly explain about anodic protection (8 marks)
- Q3** (a) Differentiate between activation polarization and concentration polarization with an appropriate diagram. (5 marks)
- (b) Explain how to measure uniform corrosion (7 marks)
- (c) Do you think the best way to control the corrosion attack is during design stage? Give your opinion with suitable sketch. (8 marks)

- Q4** (a) Describe the regimes of framework for treating atmospheric corrosion. (5 marks)
- (b) Distinguish between uniform and localized corrosion. (7 marks)
- (c) Justify why in certain circumstances, volatile corrosion inhibitor is more efficient compared to applying coating. (8 marks)
- Q5** (a) Interpret the corrosion attack for metal X and metal Y in the **Figure Q5 (a)** (5 marks)
- (b) Explain the major factors affecting atmospheric corrosion. (7 marks)
