

CONFIDENTIAL

UNIVERSITI TUN HUSSEIN ONN MALAYSIA

**FINAL EXAMINATION
SEMESTER II
SESSION 2021/2022**

COURSE NAME : DIGITAL COMMUNICATION

COURSE CODE : BEJ 41103

PROGRAMME CODE : BEJ

EXAMINATION DATE : JULY 2022

DURATION : 3 HOURS

- INSTRUCTION
1. ANSWER ALL QUESTIONS
 2. THIS FINAL EXAMINATION IS AN **ONLINE** ASSESSMENT AND CONDUCTED VIA **CLOSED BOOK**
 3. STUDENTS ARE **PROHIBITED** TO CONSULT THEIR OWN MATERIAL OR ANY EXTERNAL RESOURCES DURING THE EXAMINATION CONDUCTED VIA **CLOSED BOOK**

THIS QUESTION PAPER CONSISTS OF **FOUR (4)** PAGES

CONFIDENTIAL

- Q1** (a) Next-generation wireless access networks will require low-cost and high-capacity deployment to meet customer demand. Discuss why digital transmission is a promising solution in the context of 5G ultra-reliable low latency communications (URLLC). (10 marks)
- (b) Consider that a 100 kbps data stream transmitted on a voice-grade telephone circuit with a bandwidth of 3 kHz. Determine the possibility of acquiring error-free transmission with a signal-to-noise ratio (SNR) of 10 dB. If it is not possible, suggest **TWO (2)** system modifications that might be made. (5 marks)
- (c) Coordinated Multipoint (CoMP) technology in LTE-Advanced allows multiple cells to cooperate and can be seen as a virtual multiple input multiple output (MIMO) system. Compare 8×8 conventional MIMO and 8×8 network MIMO. Provide appropriate block diagrams where needed. (10 marks)

- Q2** (a) Timing error occurs in synchronization as a result of frequency difference between two physically oscillators (transmitter and receiver). Analyze the effects of frequency difference in asynchronous character transmission with data rate of 10 kbps as shown in **Figure Q2 (a)**. (8 marks)
- (b) Energy-efficient wireless network, which emphasizes energy efficiency as well as spectrum efficiency, have been proposed as an effective solution and are becoming the mainstream for future wireless network design. Consider the downlink of a single cell Orthogonal Frequency Division Multiple Access (OFDMA) network consisting of K mobile users. The total bandwidth B is equally divided into N subcarriers.
- (i) Identify **TWO (2)** types of diversities available in the network. (2 marks)
- (ii) Discuss the relationship between spectrum-efficient and energy-efficient designs. (8 marks)
- (c) Feedback diversity and maximal ratio combining (MRC) are two classes of space diversity reception methods. As an engineer in a telecommunication service company, you are required to suggest **ONE (1)** method that offers significant benefits to the company. Justify your choice of method in terms of the implementation complexity and resulting fading statistics. (7 marks)
