

CONFIDENTIAL

UNIVERSITI TUN HUSSEIN ONN MALAYSIA

**FINAL EXAMINATION
SEMESTER I
SESSION 2019/2020**

COURSE NAME : SOLID MECHANICS
COURSE CODE : DAM 21003
PROGRAMME CODE : DAM
EXAMINATION DATE : DECEMBER 2019 / JANUARY 2020
DURATION : 3 HOURS
INSTRUCTION : ANSWER FIVE (5) QUESTION ONLY

TERBUKA

THIS QUESTION PAPER CONSISTS OF SEVEN (7) PAGES

CONFIDENTIAL

- Q1** (a) Describe stress. (3 marks)
- (b) Determine the deformation of the steel road shown in **Figure Q1(b)** under the given loads. ($E=200$ GPa) (5 marks)
- (c) Determine the reactions at A and C for the steel bar and loading shown in **Figure Q1(c)**, assuming a close fit at both supports before the loads are applied. (12 marks)
- Q2** (a) State and sketch **four (4)** classifications of beams (8 marks)
- (b) A beam AB 10m long has supports at its ends A and B. It carries a point load of 2.5 kN at 3m from A and a point load of 2.5 kN at 7m from A and a uniformly distributed load of 0.5 kN/m between the point loads. Draw the shearing force and bending moment diagrams for the beam. (12 marks)
- Q3** (a) Give **two (2)** examples of composite beam. (2 marks)
- (b) Determine the location of the centroid of the plane as shown in **Figure Q3(b)** (4 marks)
- (c) A cross-sectional area of the beam is shown in **Figure Q3(c)**. If the limiting bending for the material of the beam are 160 MPa in torsion and 80 MPa in compression. Find length of the beam, L if the beam is simply supported at both ends with uniform distributed load along the beam of 3 kN/m. (14 marks)
- TERBUKA**
- Q4** (a) What is torsion and give **three (3)** examples of assumption to determining the relationship of the shearing stress in circular shaft subjected to torsions.

(4 marks)

- (b) Refer to **Figure Q4(b)**, knowing that the internal diameter of the hollow shaft shown is $d = 23$ mm, determine the maximum shearing stress caused by a torque of magnitude $T = 1.0$ kNm.

(6 marks)

- (c) A solid circular shaft transmits 75kN at 200rpm. Calculate the shaft diameter, if the twist in the shaft is not to exceed 1° in 22 meters length of shaft and the shear stress is limited to 50 MPa. Take $G = 100$ GPa

(10 marks)

- Q5** (a) Briefly explain the definition of thin cylinder.

(2 marks)

- (b) A boiler of 600 mm diameter is built of steel plate. If a 4 MPa inner pressure is applied to the boiler, calculate the thickness of the steel plate. Given the maximum longitudinal stress is 400 MPa.

(4 marks)

- (c) A boiler with 2 m diameter and 2 m long constructed from 10 mm thick steel plate is subjected to an internal pressure MPa. If the Modulus of Elasticity 200 GPa, and Poisson ratio of 0.3. Determine;

- (i) The change in the diameter

(5 marks)

- (ii) The change in the length

(5 marks)

- (iii) The change in the volume

(4 marks)

TERBUKA

- Q6** (a) Give two (2) methods to compute principal stresses.. (2 marks)
- (b) The state of plane stress at a point on a body is shown on the element in the **Figure Q6(b)**. Draw the Mohr's Circle for the state of plane loaded. And determine :
- (i). The principle plane angle (6 marks)
 - (ii). The Principle stress (6 marks)
 - (iii). The maximum shearing stress (6 marks)

- END OF QUESTION -
