

UNIVERSITI TUN HUSSEIN ONN MALAYSIA

**FINAL EXAMINATION
SEMESTER III
SESSION 2018/2019**

COURSE NAME : MASS AND ENERGY BALANCE
COURSE CODE : DAK 22903
PROGRAMME CODE : DAK
EXAMINATION DATE : AUGUST 2019
DURATION : 3 HOURS
INSTRUCTION : ANSWER FIVE (5) QUESTIONS ONLY

TERBUKA

THIS QUESTION PAPER CONSISTS OF NINE (9) PAGES

- Q1**
- (a) (i) State **four (4)** basic dimensions of units. (4 marks)
- (ii) Distinguish between density and specific volumes. (4 marks)
- (b) Express the dimensions for the parameters below using the symbol of M, L and T.
- (i) Force
- (ii) Pressure (2 marks)
- (c) Convert the values below into their equivalent SI units.
- (i) 57 lbm.ft/min²
- (ii) 1 gram/cm³ (4 marks)
- (d) If a mixture of gases contains 7.50 g of H₂, 3.25 g of O₂, and 5.55 g of N₂, calculate the mole fraction of each gas. Given that, H = 1 g/mol, O = 16 g/mol, N = 14 g/mol. (6 marks)
- Q2**
- (a) Explain **four (4)** general separation techniques. (8 marks)
- (b) State whether the statements below is true or false.
- (i) There are total of five (5) types of general separation techniques.
- (ii) Separation using a solid agent can be done via absorption process.
- (iii) Distillation is preferred when the differences of volatility among the components in are not sufficiently large.
- (iv) Electrical force field is also considered as one of a separating agent. (4 marks)
- (c) 2500 kg/h of a mixture of benzene and toluene containing 75% benzene by mass is separated into two fractions. The mass flow rate of benzene in the top stream is 550kg/h and that of toluene in the bottom stream is 475kg/h.
- (i) Draw and label a flowchart of the process. (2 marks)
- (ii) Calculate the unknown component flow rates. (6 marks)

TERBUKA

- Q3** (a) State **two (2)** purpose of constructing a mass balance diagram. (4 marks)
- (b) Candy production started when a flavored sugar solution is initially dried using a single evaporator (E), and followed by two crystallizers (C_1 and C_2). The process starts when 3000 kg/h of feed solution (F) containing 20 wt% sugar is fed to an evaporator, which evaporates some water at 453K to produce 63 wt% of sugar solution. This solution is then fed to the first crystallizer (C_1) at 297K, where candy containing 73 wt% sugar is produced. In this first crystallizer, saturated solution containing 30 wt% sugar is recycled back to the evaporator. Next, the candy is fed to the second crystallizer (C_2) where candy containing 93 wt% sugar is produced. In this second crystallizer, saturated solution containing 30 wt% sugar is recycled back to the first crystallizer.
- (i) Draw the mass balance diagram for the problem above. (3 marks)
- (ii) Calculate the mass flowrate of the output in the second crystallizer, C_2 in kg/h. (4 marks)
- (iii) Calculate the mass flow rate of the exit stream in the evaporator, E in kg/h. (9 marks)

TERBUKA

Q4 (a) Define the following terms.

(i) Boundary

(ii) Recycle stream

(iii) Bypass stream

(6 marks)

(b) A desalination plant can supply 5,000 m³ of freshwater per month. The seawater contains 94.5 wt% water, 3.5 wt% salt and 2 wt% of ultrafine sand particles. At the first stage of desalination process, 100 % the ultrafine sand particles will be removed via multi-media filters. The filtered seawater containing only water and salt will then be pressurized up to 1000 psi to allow the water pass through the reverse osmosis membranes to produce clean water (H₂O). However, the reverse osmosis process only able to convert 45 wt% of the seawater into pure water, while the 55 wt% of unrecovered water will be discharged together with the salt.

(i) State the component A, B and C for this process.

(3 marks)

(ii) Draw the mass balance diagram for this process.

(4 marks)

(iii) Determine the mass flow rate for all streams involved in this process in kg/month.

(7 marks)

Q5 (a) Define limiting and excess reactant.

(4 marks)

(b) Hexane (C₆H₁₄) at 535°C and 15 atm flows into the reactor at a rate of 3300 kg/h. Calculate the volumetric flowrate of this stream by using the conversion from standard conditions.

(6 marks)

(c) Calculate the ΔH° for the following reaction:

Given the following information.

$$\Delta H^\circ = 436.4 \text{ kJ}$$

$$\Delta H^\circ = 192.5 \text{ kJ}$$

$$\Delta H^\circ = -72.4 \text{ kJ}$$

(10 marks)

TERBUKA

- Q6** (a) Define the terms below.
- (i) Latent heat
 - (ii) Heat of fusion
 - (iii) Heat of vaporization
- (6 marks)
- (b) A stream of n-pentane are been heating from -150°C until $+150^{\circ}\text{C}$ in the separator.
- (i) Construct a hypothetical path for this process.
(6 marks)
 - (ii) Determine the power required for this process.
(8 marks)
- Q7** A 100 mol/s of benzene and toluene liquid at 50°C is partially condensed out of a gas stream containing 85 mole% of benzene. The top product containing 90 mole% benzene and the bottom product is 56 mol/s containing only toluene liquid. Both products are coming out at 350°C .
- (a) Draw the diagram for this process.
(6 marks)
 - (b) Determine the required heat cooling rate in kW.
(14 marks)

– END OF QUESTIONS –

FINAL EXAMINATION

SEMESTER/SESSION : SEM III/ SESSION 2018/2019
 COURSE NAME : MASS AND ENERGY BALANCE

PROGRAMME : DAK
 COURSE CODE: DAK 22903

Form 1: $C_p[\text{kJ}/(\text{mol}\cdot^\circ\text{C})]$ or $[\text{kJ}/(\text{mol}\cdot\text{K})] = a + bT + cT^2 + dT^3$
 Form 2: $C_p[\text{kJ}/(\text{mol}\cdot^\circ\text{C})]$ or $[\text{kJ}/(\text{mol}\cdot\text{K})] = a + bT + cT^2$

Example: $(C_p)_{\text{acetone}(g)} = 0.07196 + (20.10 \times 10^{-3})T - (12.78 \times 10^{-5})T^2 + (34.76 \times 10^{-12})T^3$, where T is in $^\circ\text{C}$.

Note: The formulas for gases are strictly applicable at pressures low enough for the ideal gas equation of state to apply.
