**FINAL EXAMINATION
SEMESTER 1
SESSION 2018/2019**

COURSE NAME : REINFORCED CONCRETE DESIGN 1
COURSE CODE : BFC 32102
PROGRAMME CODE : BFF
EXAMINATION DATE : DECEMBER 2018/JANUARY 2019
DURATION : 2 HOURS 30 MINUTES
INSTRUCTION : 1. OPEN BOOK EXAMINATION
2. PART A : ANSWER ALL QUESTIONS
PART B : ANSWER TWO (2) QUESTIONS
3. DESIGN SHOULD BE BASED ON:
BS EN 1990:2002+A1:2005
BS EN 1991-1-1:2002
BS EN 1992-1-1:2004

TERBUKA

THIS QUESTION PAPER CONSISTS OF SEVEN (7) PAGES

PART A : ANSWER ALL QUESTIONS

Q1 Figure Q1(a) shows part of the plan view of an extension building. The extension part of the floor is using precast concrete slab spanning in one-direction and supported by the cantilever cast in-situ reinforced concrete beam. Due to the mistakes during construction, beam A has been built as trapezoidal section instead of rectangular section. The details of beam A are shown in Figure Q1(b) and Figure Q1(c). Given the following data:

Characteristic strength of concrete	= 30 MPa
Characteristic strength of steel reinforcement	= 500 MPa
Unit weight of reinforced concrete	= 25 kN/m ³
Unit weight of precast concrete	= 25 kN/m ³
Unit weight of mortar as the finishes	= 22 kN/m ³
Variable action	= 3 kN/m ²

Prove that moment capacity of beam A is adequate at ultimate limit state.

(30 marks)

PART B : ANSWER TWO (2) QUESTIONS ONLY

Q2 Figure Q2 shows part of key-plan of an office building that needs to be designed as meeting room. Precast half-slab is considered for area J-H/5-5a, while slab J-H/5a-6 will be constructed using conventional reinforced concrete component. The beams consist of continuous and simply supported with overall size of 250 mm x 500 mm. Given the following specifications:

Fire resistance	= R120
Exposure classes	= XC1
Strength of concrete, f_{ck}	= 27 MPa
Strength of steel, f_{yk}	= 460 MPa
Nominal cover	= 40 mm
Unit weight of concrete	= 25 kN/m ³
Floor finishing	= 1.25 kN/m ²
Diameter of link	= 10 mm

Consider beam 5a/J-H as a secondary beam, which is supported by beams J/5-6 and H/5-6.

- Analyze the bending moment and shear force of the beam. The thickness of slab can be taken as 150mm. (10 marks)
- Verify that the designation of 2H20 and 2H12 as tensile and compression reinforcements should be sufficiently allocated for the beam. (10 marks)
- Check the serviceability of the beam in term of deflection requirement. (10 marks)
- Draw the complete detailing of the beam. Provide the maximum allowable spacing of shear reinforcement. (5 marks)

Q3 A continuous flange beam in **Figure Q3** has a width, $b_w = 250$ mm and an effective depth, $d = 500$ mm with two equal spans, $L = 6$ m. In the transverse direction, the spacing of beams $B = 3.0$ m centres with a slab thickness of $h_f = 150$ mm. The supports have a width of 300 mm. The uniformly distributed ultimate design load is $w_u = 200$ kN/m. The characteristic strength of the concrete and steel are $f_{ck} = 30$ N/mm² and $f_{yk} = 500$ N/mm².

- (a) Determine the maximum shear force, V_{max} and maximum bending moment, M_{max} . (10 marks)
- (b) Verify the longitudinal reinforcement at mid-span of interior first end-span AB. Use H12 and H16 (15marks)
- (c) Design the shear link at supports A and C if member inclined at an angle $\vartheta = 22^\circ$ to the horizontal. Use H6 links. (10 marks)

Q4 **Figure Q4** shows the first floor plan of a double storey house. The concrete slabs and beams are poured together and the thickness of slab is 150 mm. All beams' dimensions are 250 mm x 450 mm. Slab S3 is used to support a rectangular planter box (consider full of soil) with size of 4000mm (L) x 2200mm (W) x 500mm (H). The permanent and variable actions for all slabs are as follows:

Ceiling and tile finishes	= 2.5 kN/m ²
Variable action	= 3.5 kN/m ²
Characteristic strength of concrete, f_{ck}	= C30/37
Characteristic strength of steel, f_{yk}	= 500 N/mm ²
Concrete cover	= 30 mm
Unit weight of concrete	= 25 kN/m ³
Bulk unit weight of soil	= 15 kN/m ³

- (a) Evaluate the slab type of S1, S2, S3 and S4 and draw their actions distribution. (4 marks)
- (b) Calculate the design action of slab S3. (6 marks)
- (c) Determine the positive and negative moments of slab S3. (8 marks)
- (d) Determine the minimum and maximum area of reinforcement for slab S3. (6 marks)
- (e) Design the flexural reinforcement required at mid span of slab S3. Assume bar size is 12 mm. (11 marks)
