

UNIVERSITI TUN HUSSEIN ONN MALAYSIA

**FINAL EXAMINATION
SEMESTER I
SESSION 2016/2017**

TERBUKA

COURSE NAME : VIBRATION
COURSE CODE : BNJ 30103
PROGRAMMECODE : BNJ
EXAMINATION DATE : DECEMBER 2016 /JANUARY 2017
DURATION : 3 HOURS
INSTRUCTION : ANSWERS ALL QUESTIONS IN SECTION A, ONE (1) QUESTION IN SECTION B AND ONE (1) QUESTION IN SECTION C

THIS QUESTION PAPER CONSISTS OF **EIGHTEEN (18)** PAGES

SECTION A : ALL QUESTIONS FROM SECTION A

- Q1** (a) Packaging products are exposed to hazards within the distribution environment. List down the hazards that can cause damage to the packaging products. (5 marks)
- (b) Differentiate between free and forced vibration. (5 marks)
- (c) A freely vibrating spring mass system has a spring ($k=30$ lbs/inch) and a weight of 2 lbs. Generate the maximum acceleration if the maximum displacement is $\frac{1}{2}$ inch. (5 Marks)
- (d) Identify and explain the degree of freedom in **Figure 1 (d-i)** and **Figure 1 (d-ii)**. (5 Marks)
- (e) A vibrating spring-mass system has an amplitude of $A=1.7$ inches, a spring constant of $k=44$ lbs/in, and a mass of weight of 8 lbs. Calculate the maximum velocity of the mass, expressed in inches/second. Generate the maximum acceleration of mass, expressed in inches/seconds. (5 marks)
- Q2** (a) The **Figure Q2 (a-i)** and **Figure Q2 (a-ii)** in the appendix show a simple model of a motor vehicle that can vibrate in the vertical direction while traveling over a rough road. The vehicle has a mass of 1200kg. The suspension system has a spring constant of 400 kN/m and a damping ratio of $\zeta = 0.5$. If the vehicle speed is 20 km/hr, Solve the displacement amplitude of the vehicle. The road surface varies sinusoidally with an amplitude of $Y = 0.05$ m and a wavelength of 6m. (10 Marks)
- (b) A 10 lb weight is placed upon a piece of linear cushion. The cushion is observed to compress 0.20 inches.
- (i) Calculate the linear spring constant of the cushion. (5 marks)
- (ii) Propose the frequency that would this spring mass system vibrate if it were allowed to vibrate freely. (5 marks)

- (iii) A 3lb weight and a 9 lb weight are placed on top of 10 lbs weight which sits on the cushion. Calculate the static deflection of the cushion and what is the natural frequency of the system.

(5 marks)

SECTION B: ANSWER ONE (1) QUESTION IN SECTION B

- Q3** (a) A one hundred pound product measures 10 in x 10 in x 10 in and can sustain up to a 60 g shock without damage. It is equally sensitive to shock on all six faces. If a maximum drop height of five feet is expected in the distribution, Calculate the modulus elasticity of the required cushion material. Assume that the working length of the cushion material is fifty percent of the cushion total thickness

(10 marks)

- (b) Suppose by using a shock machine **Figure Q3 (b-i)** programmed to produce half sine shockpulses of 20 milliseconds durations, it was found that a product can withstand 100 g's. At higher acceleration there is damage to a critical element. The critical element has a natural frequency of 80 Hz and the entire product weights four pounds. In distribution a cushion for which $k_2 = 750$ lb/in and will expect a maximum drop of four feet. Using an appropriate methods and calculations, assess the condition of the package products. Use **Figure Q3 (b-ii)** in working on the assessment.

(10 marks)

- (c) A 147 lb article is dropped 38 inches on to a cushion with a linear spring $k_2 = 1462$ lb/in. Estimate the duration of the shock.

(5 marks)

Institut Teknologi Sepuluh Nopember
 Departemen Teknik Industri
 Jalan Raya Sepuluh Nopember
 Surabaya 60115

- Q4** A spring mass system with a natural frequency $f_n = 16 \text{ Hz}$ is attached to a vibration table. The table is set to vibrate at 12 Hz , 0.5 g maximum acceleration.
- (a) Calculate the amplitude of the table's motion in inches. (5 marks)
 - (b) Generate the magnification factor M in this situation. (5 marks)
 - (c) Propose is the maximum displacement of the mass assuming 0 damping. (5 marks)
 - (d) Solve the maximum acceleration of the mass assuming 0 damping. (5 marks)
 - (e) Differentiate between static and dynamic unbalance. (5 marks)

SECTION C : ANSWER ONE (1) QUESTION IN SECTION C

- Q5** (a) Plot a damage boundary curve using the following data **Table Q5 (a-i)** and **Table Q5 (a-ii)** and shock machine calibration values in **Table Q5 (a-iii)** (10 marks)
- (b) Suppose a cubic product weighing 50 pounds and measuring twelve inches on a side. The product's fragility is described by the damage boundary curve shown in **Figure Q5 (b)**. In distribution the product package system to be dropped from a maximum height of 30 inches. It is expected that the packages will be dropped more than once from that maximum drop height. Design an Ethafoam 220 polyethylene cushion to protect the product (**refer Figure Q5 (b-I & ii)**). (10 marks)
- (c) Discriminate the main objectives of product packaging testing. (5 marks)
- Q6** (a) Plot a damage boundary curve using the following data **Table Q6 (a-i)** and **Table Q6 (a-ii)** and shock machine calibration values in **Table Q5 (a-iii)** (10 marks)
- (b) A 40 pound product is encased in linear cushioning material , for which $k=200$ lb/in. The product within its cushioning is securely fastened to the floor of a railcar. The railcar is coupled to the rest of the train at 10 miles per hour. If the working length of the cushion materials is 40% of the total length , Prove the minimum thickness of the cushion needed to prevent "bottoming out" against the outside container. Prove also the d_m , G_m and τ at the product. (10 marks)
- (c) Identify the important parameters in selecting the right accelerometer for a particular application. (5 marks)

| $T = \frac{\eta}{\sqrt{\frac{k2g}{w^2}}}$ | Natural frequency $f_n = f \sqrt{(1 - \xi)^2}$ |
| Damped vibration $\ln \frac{A_1}{A_2} = \frac{2\pi\xi}{\sqrt{(1 - \xi)^2}}$ | Damped vibration $\frac{A_1}{A_2} = e^{\frac{2\pi\xi}{\sqrt{(1 - \xi)^2}}}$ |
| Damped vibration $T = \sqrt{\left[\frac{1 + [2\xi(\frac{f}{f_n})]^2}{1 - (\frac{f}{f_n})^2 + [2\xi(\frac{f}{f_n})]^2} \right]}$ | Free falling package $t = \sqrt{\frac{2h}{g}}$ $v_I = \sqrt{2gh}$ - the impact velocity $V_R = e v_I$ $\Delta v = V_R + v_I $ and since we know e and v_I $\Delta v = (1 + e)v_I = (1 + e)\sqrt{2gh}$ |

FINAL EXAMINATION

SEMESTER / SESSION : SEM I / 2016/2017
 COURSE NAME : VIBRATION

PROGRAMME CODE : BNK
 COURSE CODE : BNJ 30103

Formula Table

| | |
|--|---|
| <p>Mechanical shock Theory $KE = \frac{1}{2} M_2 V_1^2$ substituting $KE = \frac{1}{2} M_2 (2gh) = M_2gh = W_2 h$ $E = \frac{1}{2} k_2 x_2^2$</p> | <p>Mechanical shock Theory $KE = W_2h = E_{max} = \frac{1}{2} k_2 d_m^2$ $W_2h = \frac{1}{2} k_2 d_m^2$ $d_m = \sqrt{\frac{2W_2h}{k_2}}$</p> |
| $\delta_{st} = \frac{W_2}{k_2}$ $d_m = \sqrt{2h \delta_{st}}$ | $P_{max} = k_2 x_2 = k_2 d_m = k_2 \sqrt{\frac{2W_2h}{k_2}}$ $P_{max} = \sqrt{2k_2 W_2 h}$ |
| $G_m = \frac{P_{max}}{W_2}$ $G_m = \sqrt{\frac{2k_2 W_2 h}{W_2}}$ $G_m = \sqrt{\frac{2k_2 h}{W_2}}$ $G_m = \sqrt{\frac{2h}{\delta_{st}}}$ | $G_m \propto \sqrt{h}$ $k_2 = \frac{W_2 G_m^2}{2h}$ $k_2 = \frac{2W_2 G_m^2}{d_m^2}$ $d_m = \sqrt{\frac{2W_2 h}{k_2}} \left(\sqrt{\frac{2h}{2h}} \right)$ $d_m = \sqrt{\frac{2W_2 h 2h}{k_2 2h}} = 2h \sqrt{\frac{W_2}{2k_2 h}} = \frac{2h}{\sqrt{\frac{2k_2 h}{W_2}}} = \frac{2h}{G_m}$ |
