

UNIVERSITI TUN HUSSEIN ONN MALAYSIA

**FINAL EXAMINATION
SEMESTER II
SESSION 2016/2017**

COURSE NAME : ENGINEERING MECHANICS
COURSE CODE : BDU 10503
PROGRAMME : BDC / BDM
DATE : JUNE 2017
DURATION : 3 HOURS
INSTRUCTIONS : ANSWER **FIVE (5)** QUESTIONS ONLY
OUT OF **SIX (6)** QUESTIONS

TERBUKA

THIS QUESTIONS PAPER CONSIST OF **SIX (6)** PAGES

- Q1** A statics experimental setup as shown in **Figure Q1** is mounted at a concrete wall. Point B and C which are holding the cable are connecting at the same point of A . A weighing block hanging at point A produce a tension of 560 N along the AB cable.
- (i) Express the unit vectors of U_{AB} and U_{AC} . (6 marks)
- (ii) Calculate the force vector of F_{AB} . (4 marks)
- (iii) Using a Vector Dot Product, distinguish the magnitude projected component of the force acting along AC cable. (6 marks)
- (iv) Solve the projected component in cartesian vector. (4 marks)
- Q2** (a) **Figure Q2(a)** shows forces acting at column which is mounted at floor. Determine and locate the resultant force measuring from point A (10 marks)
- (b) Predict the distributed loading as shown in **Figure Q2(b)** with an equivalent resultant force, and specify its location on the beam measured from A . (10 marks)
- Q3** An Architect had proposed a construction design drawing of a roof truss as illustrated in **Figure Q3**. As a Design Engineer you need to analyze the force acting on the truss. Assuming the horizontal components of force at the support are neglected;
- (i) Calculate the reaction force of F_A and F_G . (4 marks)
- (ii) Sketch the force acting at section $1-1$ and $2-2$. (6 marks)
- (iii) Determine the force along truss CD and DE . (6 marks)
- (iv) Using the method of joint at point D , distinguish the force acting along DJ , F_{DJ} . (4 marks)

- Q4** (a) Differentiate between kinetics and kinematics. (4 marks)
- (b) Sketch and explain three types of rigid body motions. (6 marks)
- (c) A car moves in a straight line such that for a short time its velocity is defined by $v = (0.9t^2 + 0.6t)$ m/s where t is in seconds. At $t = 3$ s;
- (i) Determine the car position. (6 marks)
- (ii) Calculate its accelerations. (4 marks)
- Q5** A rotating equipment with a 3 phase electric motor is used to turn a pulley attached to the blower fan as shown in **Figure Q5**. Pulley A and B within a given diameter of 300mm and 800mm respectively is connected using transmission v belt. If pulley A begins to rotates from rest with an angular acceleration of $\alpha_A = 2 \text{ rad/s}^2$ and no transmission belt slip occurred. Just after pulley B complete 360° revolution;
- (i) Analyze the velocity of point P at pulley B .
- (ii) Calculate the acceleration of point P at pulley B . (20 marks)
- Q6** (a) State the possibilities of impact in particles and impact in rigid body. (3 marks)
- (b) Two discs A and B , have a mass of 3kg and 5kg respectively. They collide with the initial velocities as shown in **Figure Q6** with the coefficient of restitution, $e = 0.65$. Given that $V_A = 6 \text{ m/s}$, $V_B = 7 \text{ m/s}$ and $\theta = 60^\circ$.
- (i) Calculate the velocities of both discs just after the impact. (12 marks)
- (ii) Analyze the directions measuring from positive x-axis. (5 marks)
