UNIVERSITI TUN HUSSEIN ONN MALAYSIA

**FINAL EXAMINATION
SEMESTER II
SESSION 2013/2014**

COURSE NAME : MECHANICS OF MATERIAL
COURSE CODE : DAC 20703
PROGRAMME : 2 DAA
EXAMINATION DATE : JUNE 2014
DURATION : 3 HOURS
INSTRUCTION : ANSWER **FIVE (5)** QUESTIONS
OUT OF **SIX (6)** QUESTIONS

THIS QUESTION PAPER CONSISTS OF **SEVEN (7)** PAGES

CONFIDENTIAL

- Q1**
- (a) List types of stress in the material strength. (5 marks)
- (b) Explain briefly about stress-strain diagram. (5 marks)
- (c) A steel bar of length 130 cm tied between two walls at a temperature of 80 °C. Steel bar area is 4cm², α value is $13.3 \times 10^{-6}/^{\circ}\text{C}$ and E value is 22×10^6 N/cm². If the temperature drops to 0 °C, calculate the stress that occurs as follows:
- (i) Distance between two walls is 130 cm
 (ii) Distance between two walls is increased into 130.33 cm
 (iii) Distance between two walls is decreased into 129.95 cm (10 marks)
- Q2**
- (a) List **five (5)** types of beam. (5 marks)
- (b) Explain the procedures for obtaining the shear and bending moment diagrams. (5 marks)
- (c) Determine the shear force and bending moment by using area method for cantilever beam in Figure **Q2(c)**. (10 marks)
- Q3**
- (a) List the assumptions before bending position for a wooden plank that placed across a drain. (5 marks)
- (b) Explain about economic sections in structural installations. (5 marks)
- (c) The beam cross-section 120 mm X 180 mm and a length of 8 m is located at the support pin at A and a roller support at B. The beam carries a uniformly distributed load of 7 kN/m as shown in Figure Q3(c). Calculate the following:
- (i) The shear stress at section 1.0 m from the support pin at A

- (ii) The shear stress at 60 mm intervals from the top to the bottom of the section
 - (iii) The maximum shearing stress in the beam
- (10 marks)

Q4 (a) Sketch an example of deflection application in real world. (3 marks)

(c) Explain elastic curve. (3 marks)

(c) Evaluate $\langle x - 5 \rangle^2$ for the following cases:

(i) $x = 0$

(ii) $x = 5$

(2 marks)

(d) Determine slope and deflection of the beam at X m from roller A using the given simply supported beam AC diagram in Figure **Q4(d)**.

General equation for slope: $EI \frac{dy}{dx} = 150x^2 - 200\langle x - 0.5 \rangle^2 - 87.5$

(i) $X = 1.5$

(ii) $X = 0.25$

(12 marks)

Q5 (a) List **four (4)** assumptions made in the derivation of torsion equation. (4 marks)

(b) Given data:
 T1 = 4000 kNm
 T2 = 5000 kNm
 T3 = 3000 kNm

Referring to Figure **Q5(b)** and given data, solve:

- (i) T_4 value if system is in equilibrium
- (ii) Torques in sections AB, BC, and CD

(7 marks)

- (c) The vertical shaft AD is attached to a fixed base at D and is subjected to torques at sections A and B as shown in Figure **Q5(c)**. A hole of unknown diameter has been drilled into the centre of portion CD of the shaft. Knowing that the entire shaft is made of steel for which $G = 80 \text{ GPa}$, and $\tau_{\text{allowable}} = 50 \text{ MPa}$, solve:
- (i) Torques in shaft AB, BC, and CD
 - (ii) The maximum possible value of the hole diameter
 - (iii) The angle of twist at section A when the hole diameter size is of that in (ii)
- (9 marks)
- Q6** (a) Define critical load. (4 marks)
- (b) Write the Euler's equation for columns with the following end condition.
- (i) Both end fixed
 - (ii) One end fixed, one end free
 - (iii) One end pinned, one end fixed
- (3 marks)
- (c) Referring to Figure **Q6(c)**, determine the maximum value of the load F using Euler's formula. Use factor of safety of 4 and $E = 13 \text{ GPa}$. (13 marks)
